

## **AMENDMENTS TO THE CLAIMS**

This listing will replace all prior versions, and listings, of claims in the application:

### **Listing of Claims:**

1. (Currently amended) A thermoplastic polyolefin (TPO) roofing membrane comprising a reinforcement scrim sandwiched between cap and base layers which are pressed into a single ply membrane having a thickness of about 35-90 mils, characterized in that both of said layers are made of, by weight, 50-90% of metallocene-catalyzed ~~polyolefin~~ polyethylene and about 10-50% of additives including a crystallinity enhancing polymer comprising high density polyethylene (HDPE), said membrane exhibiting a 90° heat seam peel strength of  $\geq$  60 lbs/linear inch (ASTM D-413) and a cold brittleness point of  $\leq -50^{\circ}\text{C}$  (ASTM D-413).

2. (Original) A roofing membrane according to claim 1 wherein said 90° heat seam peel strength is about 66-69 lbs/linear inch over a 4 day period, and said cold brittleness point is about  $-58$  to  $-70^{\circ}\text{C}$ .

3 -4. (Canceled)

5. (Original) A roofing membrane according to claim 1 wherein the molecular weight distribution (MWD) of said polyolefin is about 2 to 2.5.

6. (New) A thermoplastic polyolefin (TPO) roofing membrane comprising a reinforcement scrim sandwiched between cap and base layers which are pressed into a single ply membrane having a thickness of about 40-90 mils,

wherein both of said cap and base layers are produced by a process comprising combining, by weight:

- (a) 50-90% of metallocene-catalyzed polyethylene;
- (b) an ethylene-propylene rubber (EPR); and

(c) a crystallinity enhancing polymer comprising (i) high density polyethylene (HDPE) and (ii) polypropylene (PP) having a crystallinity of 50 wt.%.
